Final Audit Report — Music-Gen Run (Delta Audit, second pass)

- Run id: run-2026-08-28T040704Z
- Mode: **delta (second pass)** — baseline boundary 2026-09-05T00:11:46Z (the prior delta-audit commit of this document).
- Scope: only NEW per-cycle deliverables newer than that boundary.
- Delta report set in scope this pass: **one** — reports/cycles/report_cycles_31-31.md (Music-Gen v4 Cycle 31 Closure, 2026-09-05). This report was also the subject of the prior committed delta audit; the disk-side artifacts it references are unchanged since that commit (verified by mtime + byte-anchored SHA checks in Stage 3).
- Wall-cap hit: false.

1. Executive summary

The delta window since the last committed audit contains **no new substantive artifacts** and **no new campaign motion**. The single report in scope is the same c31 closure report audited at the prior commit; its cited artifacts are unchanged on disk. Both validators run clean at 0 ERROR under this pass.

Two findings carry forward from the prior audit and are re-confirmed on their own evidence by this pass (F1 ledger-vs-disk parity gap for v4 substantive milestones, and F2 absence of a c31-specific audit-findings artifact on disk). Neither is new to this delta window, so both are reported here as re-confirmations only, not new discoveries; the prior committed report remains the canonical record of them.

No reconciliation events are proposed by this pass. No new findings were surfaced during the Stage-2 (Verify) or Stage-3 (Test) adversarial re-checks. One new lesson candidate is offered

— a general observation about recursive delta audits over an unchanged surface — distinct from the two lessons the prior audit landed and within the harness cap of $\max(1, \text{ceil}(1/3)) = 1$ for this scope.

2. Status distribution (delta slice)

The delta slice added zero new milestones. The status distribution of the milestones touched or introduced in the c31 closure report is identical to the prior committed audit:

status	count
validated (high)	47
in-progress	1
action_required	1
deferred	3
superseded (implicit)	1
invalidated	0
not-started	4

The “superseded (implicit)” row is the same M-V4-RULES-1 c20 scaffold whose on-disk state was replaced by a c21 + substantive implementation without an `explicit_plan/register-*` ledger event; the prior audit filed this and it stands unchanged.

3. Plan adherence

No new plan-of-record commitments landed since the prior committed audit. Every substantive milestone in the c31 closure retains the terminal status and confidence recorded in the prior report. The invariants the prior audit checked (three-way rubric_hash* byte-equality chain, byte-determinism $\times 2$ where applicable, READ-ONLY anchor preservation) are unchanged because the artifacts they cover are unchanged.

4. Confidence calibration

Zero terminal states in the delta slice carry low or provisional confidence. All 47 validated events remain at high per the prior committed record. Two calibration notes from the prior audit continue to apply and are re-noted here without change:

- M-V4-RULES-1 status is a POR-narrative-vs-on-disk split (scaffold registered in POR; substantive implementation lives on disk without a completion event) — reported as F1.
 - M-V4-SHOWCASE-1/cg-ab-full-render LANDS_pending_operator is a high-confidence gate on internal invariants; operator ear remains the LANDS authority per FD-6.
-

5. Residual debt

Residual debt is unchanged since the prior committed audit. The concrete items carried forward are:

- **Ledger vs. on-disk parity gap for M-V4-EAR-1, M-V4-GEN-1, M-V4-CLOSE-1, and the substantive M-V4-RULES-1 extraction.** Artifacts are on disk with matching SHAs; ledger events for the completion never landed. The c31 closure report itself discloses this as a bookkeeping MODERATE. See F1 below.
 - **c31 audit-findings artifact not on disk.** The c31 closure narrates an independent audit as COMPLETE but no per-cycle findings JSON/MD is discoverable under audits/. See F2 below.
 - `_manager/M-V4-METRIC-SEMANTICS-c16` remains `action_required`, `blocked_on_operator=true`.
 - `_manager/M-V4-SHOWCASE-1-cg-bass-acceptance-policy` remains an operator-authority policy fork from c7.
 - **M-V4-EAR-1, M-V4-GEN-1, M-V4-CLOSE-1** remain not-started at the plan-of-record layer even though the c31 closure report certifies the substantive work landed on disk (same parity gap as F1).
 - **Deferred but non-blocking:** three items already listed in the prior committed audit (post-cycle test-debt fillins that are already resolved, plus one `_manager` fork that is action-required-but-not-blocking downstream cycles).
-

6. Findings by severity

CRITICAL

None in the delta window. None carried forward.

MODERATE

F1 — Ledger-vs-disk parity gap for v4 substantive milestones (re-confirmed, MODERATE, CONFIRMED). `promise_ledger.jsonl` terminates at `_run/cycle_20_closed` (v4 internal c20; the last v4 ledger event marks `M-V4-RULES-1/scaffold-c20` as landed with stubs raising `NotImplementedError('c21+ substantive implementation')`). Zero events exist for `M-V4-EAR-1`, `M-V4-GEN-1`, `M-V4-CLOSE-1`, or the substantive `M-V4-RULES-1` extraction that the c31 closure report certifies LANDS on disk. The 30 rows tagged "cycle": 31 in the ledger belong to an earlier v3 palette-schema campaign, not v4 closure. Report itself surfaces this as bookkeeping MODERATE. This audit confirms the same rating on the same evidence and does not escalate. First seen: prior committed audit. This pass: re-verified, unchanged.

MINOR

F2 — c31 closure-cycle audit-findings artifact absent from disk (re-confirmed, MINOR, CONFIRMED). `find audits -name '*cycle*31*' -o -name '*c31*' empty`; the c31 closure report cites a session ID for its independent audit but no per-cycle findings artifact for c31 is on disk under `audits/final/stages/` or elsewhere. The report's COMPLETE / Zero CRITICAL verdict is supported by re-running the underlying byte-equality and arithmetic checks (this audit and the prior one both did), but on-disk audit provenance for that claim is missing. First seen: prior committed audit. This pass: re-verified, unchanged.

7. Future work

Anchored to residual-debt items above, framed for a human reader of the final report (NOT for a future researcher cycle):

1. **Reconcile the v4-closure ledger gap.** A one-shot append of completion events for M-V4-EAR-1, M-V4-GEN-1, M-V4-CLOSE-1, and the substantive M-V4-RULES-1 extraction — each carrying the on-disk artifact SHAs the c31 closure report already cites — would close F1 without any content change and restore append-only invariance for v4. This is bookkeeping only; the artifacts already exist and byte-verify.
 2. **Persist c31 audit-findings artifact.** Whatever the c31 auditor session produced (a findings list, verdict summary, or session transcript excerpt) belongs on disk under audits/final/stages/ or a per-cycle sibling directory. This closes F2 and makes the COMPLETE / Zero CRITICAL claim independently re-auditable.
 3. **Resolve _manager/M-V4-METRIC-SEMANTICS-c16.** Operator authority is required to pick Path A (distance-inverted-thresholds) or Path B (similarity-numeric-fix). Until picked, WIG / Rome / Peach Dream / Disco A profile arcs remain blocked_on this escalation.
 4. **Resolve _manager/M-V4-SHOWCASE-1-cg-bass-acceptance-policy.** Operator ear on the c17 A/B mix (per FD-6) is the standing decision path; recording the acceptance in the ledger after operator input would close the fork.
 5. **Post-hoc operator listening on the c17 CG A/B mix.** Would formally flip M-V4-SHOWCASE-1/cg-ab-full-render from LANDS_pending_operator to validated.
-

8. Reconciliation log

No reconciliation events proposed by this pass.

The prior committed delta audit did not enqueue reconciliation events either; both audits declined to reconcile F1 and F2 with new ledger writes because doing so would either (a) duplicate the c31 closure report's own bookkeeping-MODERATE disclosure without changing on-disk state, or (b) forge a completion event whose evidence line is a report the audit itself is checking. Reconciliation of F1 is the campaign's responsibility, not this audit's, and is listed as Future Work #1.

9. Delta-audit posture and closure

This second-pass delta audit finds the campaign surface unchanged since the prior commit and closes cleanly on the same substantive record. Both validators (promise_check, org_check) return 0 ERROR under this pass. Both prior findings are re-confirmed on their own evidence. No new findings, no reconciliation events, one new lesson.

The prior committed report at audits/final/final_audit_report.md@2026-09-05T00:11:46Z remains the canonical audit record for the c31 closure. This document supplements it with the empty-delta re-confirmation and lesson-candidate that this pass produced; it does not supersede it.

Appendix A — Findings JSONL

Findings recorded in audits/final/findings.jsonl for this pass: - F1: _run/cycle_31_closure_ledger_parity_gap — MODERATE, CONFIRMED (re-confirmation). - F2: _run/cycle_31_closure_audit_artifact_absent — MINOR, CONFIRMED (re-confirmation).

Zero new findings from Stage 2 (Verify) or Stage 3 (Test) beyond these two carry-forwards.
